

Not every high score deserves outreach.

An explainable weekly Sales & CS routing system. Fit, usage, and buying intent scored separately — visible gates decide each route, and every decision explains itself.

Scores rank

Gates decide

Every route explained

Explore a fictional demonstration

Fit, usage, and intent answer different questions.

1

Fit

Who is this account?

ICP and firmographics — industry, size, role, geography, environment.

ICP & firmographics

2

Product usage

Are they using the product?

Real Northfield Incident Management signals — services connected, incidents resolved, active users.

Incident Management signals

3

Buying intent

Are they ready to buy?

Pricing, SSO, security, and admin activity across the account.

Pricing · SSO · security · admin

Three scored 0–100 dimensions kept separate — no opaque universal score collapses them.

A score ranks; visible gates decide.

0–100

A score tells you where an account ranks on each dimension. It orders the list — it does not say what to do next.

Before any human action, explicit rules pick the route and assign an owner with a real SLA.

SIX VISIBLE ROUTES explicit rules

- Hand raiser
- Acquisition sales-assist
- Monitor
- Self-serve
- Manual review
- Expansion

Every route carries an owner and a real SLA — decided by gates, not by position on a ranking.

Same accounts, same capacity.

Routing Log

About

Product usage exists — but the weekly Sales & CS queue is late, noisy, over capacity, or unexplained.

A gated policy separates fit, product usage, and buying intent, then routes the right accounts to the right owner with a real SLA. This is an explainable weekly routing intervention, designed and built by Hanif Carroll.

All people, companies, usage, and outcomes are fictional or synthetic. Metrics are a synthetic method demonstration, not real business efficacy.

All evaluated gates

hard_blocks ✓ No hard blocks present

assess_review ✗ Identity and critical fit present

explicit_request ✗ No in-window explicit sales request

expansion ✗ Not a customer (requirement is customer-only)

acquisition_sales_assist ✓ Prospect fit 100>=70, usage 70>=50, intent 80>=40, activated, no hard block

assister ✓ High-fit prospect (fit 100>=70) below sales-assist threshold — monitor without a task

self_serve ✗ Fit and intent both at or above sales threshold

default_no_sales_action ✓ Prospect below all activation/sales thresholds — default self-serve (no sales task, no owner change)

Decisive evidence

• Prospect fit 100>=70, usage 70>=50, intent 80>=40

• Connected a production service

• Resolved 2 incident(s)

• Invited 3 teammate(s)

• 0 weekly active user(s)

Simulate a bounded signal

Simulate a Northfield signalProduction

Connect a production serviceYes

Simulate and recompute

One bounded, simulated signal. The server maps it to a bounded event, recomputes deterministically, and explains the change — nothing is persisted.

CRM state

No black box. Each account records exactly why it was routed.

- ✓ Itemized points behind each score
- ✓ Gates passed and failed
- ✓ Strongest rejected alternative
- ✓ Owner and SLA on the record
- ✓ CRM state synced

ROUTE

Sales assist

SLA

4 business hrs

Capacity changes prioritization, not qualification.

Acquisition intent minimum

20–70 · step 5

40

Weekly human-action capacity

5–30

12

Changing capacity reprioritizes the queue. It never changes whether an account qualifies — qualified overflow stays visibly deferred.

Qualified & routed

Within the weekly human-action budget.

Qualified, deferred

Fits and scores qualify, but the team is at capacity — still visible, never silent.

An explainable alternative to the opaque queue.
