Summary

Software engineer with 9+ years across client consulting, SaaS, and enterprise software. Works directly with clients and founders to map workflows, define scope, and build custom applications, integrations, and AI workflows. Delivery spans operational discovery and prototyping, production reliability, cross-platform launch, and handoff.

Work Experience

Founder & Software Engineer **HC Studio** **Mar 2024 – Present**

Deliver software directly for clients and founders, with engagements spanning discovery, scoping, implementation, production support, and handoff.

Desarmadero La Torre — Client software and operations prototype

- Translated client discovery into a functional specification and an interactive SvelteKit operations prototype covering sales, payment release, dismantling assignments, and vehicle lookup.
- Built a parts catalog searchable by make, model, and year, with photos so customers could check stock before calling and staff could update listings, reducing phone inquiry volume.

Genrupt — Contract AI Product Engineer

- Built AI generation, listing preparation, and image editing workflows for Amazon sellers, including OCR and inpainting; worked alongside the founder to help support Genrupt's first 200 paying customers.
- Built organization billing, shared credits, and recoverable generation jobs; used atomic PostgreSQL reservations to prevent credit overspending and provider-job reuse with idempotent settlement to prevent duplicate charges on retries.
- Connected external AI agents to market-analysis and Amazon-listing workflows through OAuth-authenticated MCP tools, with organization permissions and asynchronous results.

Palabruno — Contract AI Product Engineer

- Worked with the founder to take a Spanish-reading prototype through launch on iOS, Android, and web, including learner and teacher workflows, Stripe and RevenueCat subscriptions, release documentation, and handoff.
- Built a reading pipeline combining linguistic rules with constrained LLM generation, with checks that learning cards matched the selected word or phrase, targeted regeneration of invalid cards, and regression tests.

Mucho Hangouts — Fractional CTO

- Stabilized messaging, notifications, and sign-in in a live product by centralizing authentication and server state and fixing socket connection lifecycles, while feature delivery continued.
- Provided technical direction for a five-person team and mentored two junior developers through reviews, pairing, and reusable patterns.

Additional consulting

- Casa Elaria: Built a storefront that captured email interest at checkout without taking payment, enabling a purchase-intent test before inventory investment.
- JIEC Labs: Reviewed the shopping journey and delivered seven prioritized recommendations covering product discovery, product-page clarity, and mobile performance.

Senior Frontend Engineer **LeagueApps, later via Nearsure** **Nov 2021 – Feb 2024**

- Modernized tournament scheduling with React on the company's first migration team, helping establish shared frontend patterns and components.
- Built drag-and-drop scheduling with conflict checks to prevent double bookings, plus self-service reporting for tournament operators.

Software Engineer **Capgemini** **Jan 2019 – Oct 2021**

- Owned the reporting module and developed additional features for Disney Cruise Line's crew management system, which handled scheduling, cabin assignments, and crew contracts.
- Built KPI dashboards for Cisco; maintained Java Spring Boot microservices for GE Aviation.

Frontend Engineer **8base** **Nov 2017 – Nov 2018**

- Built Jira / GitLab CI/CD automation and refactored 20+ shared UI components into a reusable library.

Selected AI Projects

- **Switchboard — Agentic system demo:** Built a Python/FastAPI and LangGraph agent that investigates customer-change requests and proposes policy-checked changes for human approval; deployed on AWS using Step Functions, SQS, and DynamoDB.
- **Casamo — Independent product:** Built an AI product that helps digital nomads find and compare furnished accommodation on Airbnb and Booking.com, evaluating listings against their requirements using photos, amenities, and guest reviews, and highlighting trade-offs and questions to confirm before booking.

Technical Skills

Languages & backend: TypeScript, Python, Node.js, FastAPI, PostgreSQL, Supabase

AI & integrations: Anthropic and OpenAI APIs, Amazon Bedrock, LangGraph, RAG, structured outputs, tool calling / MCP, evaluations, OAuth, Stripe, RevenueCat

Frontend & delivery: React, Next.js, SvelteKit, React Native / Expo, Cloudflare Workers / Workflows, AWS, Docker, GitHub Actions, Playwright

Languages

- **English** — Native
- **Spanish** — Professional working proficiency

Education

- **B.S. in Health Sciences**, University of South Florida
